

MARCH was a Warm One for US and the U.S.

Below are web links to two short ClimateCast videos, hosted by Deke Arndt, Chief of the Climate Monitoring Branch at NOAA's National Climatic Data Center. In these videos, Arndt talks about:

- 1) the record heat during March for much of the U.S., including eastern Colorado, and the cumulative effect of the warm winter, fall and early spring on "heating degree days", an estimate of the energy demand during the U.S. cold season, and
- 2) the 2011-2012 winter - the 4th warmest winter on record for the U.S.
